Jackdzn Spider Chart

Keria Spider Chart

● Normalized Results

● Normalized Results

Jackdzn vs Keria only : same role (support)

Radar values are normalized to a 0–100 scale (100: best performer per metric) for meaningful comparison.

Findings : My findings will include the non-normalized numbers

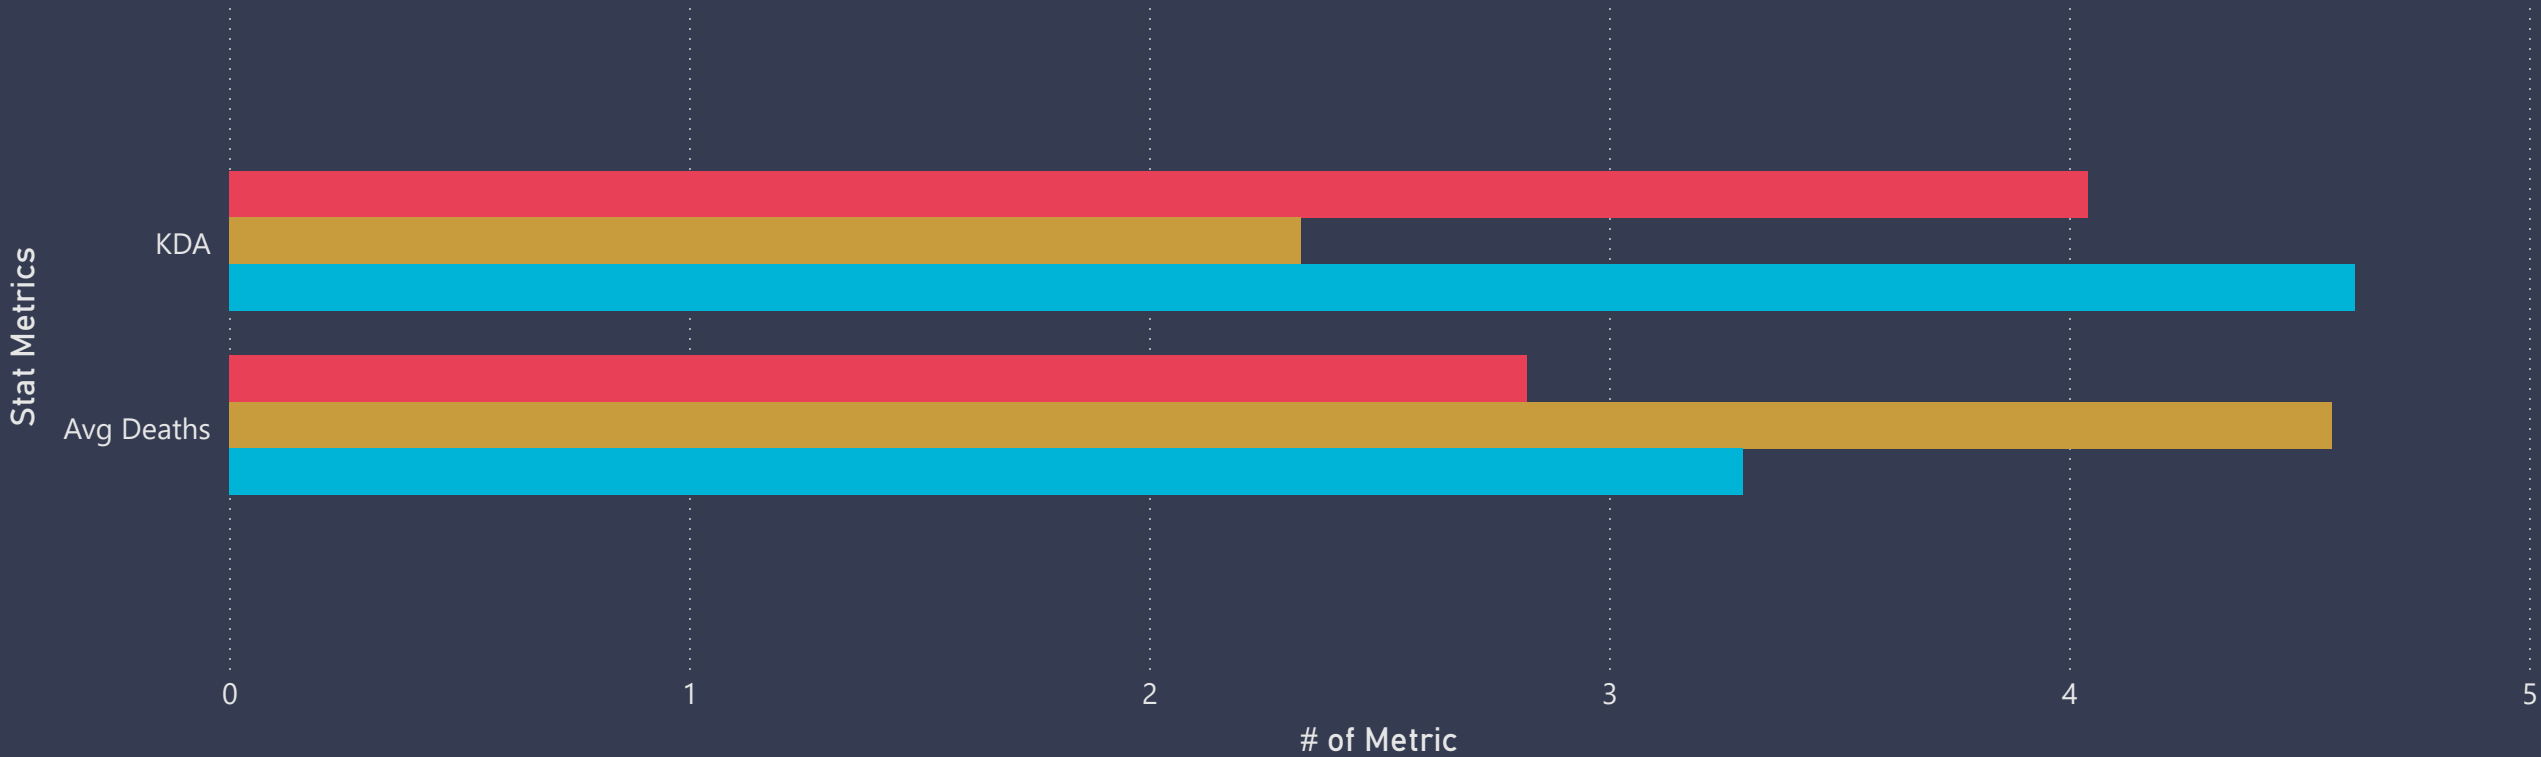

- My kill participation is 37.1% while Keria's is at 76.7%. I'm absent for 63% of the kills whereas Keria is present at least 3/4 times for his team, meaning that I roam less and farm in lane.
- My vision score is 49.3 while Keria's is 106.8: he does more than double my vision in equivalent game time
- My CS/min is 2.5, Keria's is 0.96.... I'm more likely taking your minions than roaming - we are literally on opposite sides of the chart

Comparison Bar Chart

Player ● Faker ● jackdzn ● Keria

Average KDA + Deaths of all players, equal 28-game sample for each player

Key Findings:

- I have the lowest KDA and highest average of deaths: The high average of deaths is possibly the cause of my low KDA, but because we also know that I have a low kill participation we could also assume that their both contributing factors
- Faker has the most balanced stats: with a 1.22 difference between KDA and Deaths
- Although Faker and Keria have close death avg, Keria's KDA is large, which is a result of high assist rate, not specifically survivability

All Roads Lead to Faker

Process:

- Used Riot's Developer API to pull my game metadata from my account to build my stats
 - Used Python and library pandas to extract
 - Downloaded the data into a formatted csv, then converted into excel to perform analysis and create tables for Power BI
- To collect Faker's and Keria's Data, downloaded a public excel workbook for this year from: <https://oracleselixir.com/tools/downloads> and filtered for their names
- Took all excel workbooks and connected to them inside Power BI for data visualization

Limitations:

- Riots API only pulled 42 of my own games, 4 were remakes/unavailable, and the other 10 were ARAM
 - These game modes not comparable to League Pro statistics. Ideally I could compare ranked games, however I refuse to play ranked (personal preference of mental health).
 - This limits my dataset to only 28 games of Swiftplay's
 - Worth noting that this is not a sufficient amount of games/data
 - Competition gap between casual Swiftplay and Pro competitive League is unquantifiable
- Many game metrics between Faker and I were also incomparable due to position played, which lead me to compare my stats to T1's support: Keria
 - ex. Vision Score and CS/min is not the same between a BOT SUP and Midlaner
- My raw data game length was considerably shorter (most likely due to game mode). My games averaged to be 7-10 minutes shorter which inflates me "per-minute" statistics which leads to an unequal comparison
